

Compliance, enforced at the token.

Covenant is the on-chain compliance layer for tokenized stocks. A tokenized share rejects any transfer to an unverified, sanctioned, or non-accredited wallet, and settles instantly for verified ones.

THE PROBLEM

A tokenized stock is a security. It can't move to the wrong hands.

Robinhood Chain exists to host tokenized US equities like TSLA and AMZN. By law a tokenized share **cannot** transfer to an un-KYC'd wallet, a sanctioned jurisdiction, or (often) a non-accredited investor.

The chain ships the **assets**. Every builder on its \$1M developer fund still has to solve **compliance**, and static allow-lists break the moment a token touches secondary trading or DeFi.

THE SOLUTION

The compliance layer for tokenized stocks.

Covenant enforces KYC, jurisdiction, and accreditation rules **at the token itself**. Every transfer is checked against on-chain KYC attestations before it can settle.

Modular

One ComplianceEngine, pluggable rules: jurisdiction, accreditation, holder cap. ERC-3643-aligned.

EAS-compatible

Reads canonical EAS on Arbitrum One, or a bundled attester on chains where EAS isn't deployed yet, same code.

Valid KYC in the wrong jurisdiction is still no transfer.

WITHOUT VERIFICATION

Transfer reverted

Recipient holds no KYC attestation, so the token refuses to move.

REVERTED · CountryRestriction

WITH VERIFICATION

Transfer settles

Jurisdiction, accreditation, holder cap all pass, the share moves on-chain.

That jurisdiction check is the part address allow-lists can't express.

LIVE & PROVEN ON-CHAIN

Deployed, verified, and demonstrated.

-
- 01 **Robinhood Chain testnet:** 4 source-verified contracts (CovenantAttester, ComplianceEngine, RWAToken, Factory). Also live on Arbitrum Sepolia.
 - 02 **On-chain proof:** transfer blocked → attest → transfer settles (status 0x1), all with explorer tx hashes.
 - 03 **Live demo:** connect a wallet, watch a tokenized TSLA transfer get blocked, verify the investor, watch it pass.

WHY IT WINS THE ROOM

Built for the judging criteria.

Smart-contract quality

97 Foundry tests · a 12-agent security audit with all findings fixed + regression-tested · verified source.

Product-market fit

The exact gap Robinhood Chain's builder fund leaves open.
Every tokenized-securities issuer needs it.

Innovation

A live compliance-gate verdict, a decoded KYC credential card, and an EAS-compatible attester for new chains.

Real problem

Securities transfer-restriction is a legal hard requirement, not a nice-to-have.

THE ASK

Compliance is the unlock for on-chain finance.

2

reserved-prize chains
